

Program Analysis

Operational Semantics (Part 5)

Prof. Dr. Michael Pradel

Software Lab, University of Stuttgart

Winter 2020/2021

Plan for Today

- **Motivation & preliminaries**
- **Abstract syntax of SIMP**
- **An abstract machine for SIMP**
- **Structural operation semantics for SIMP**
 - Small-step semantics
 - Big-step semantics ←

Big-step Semantics

- small-step semantics : transition relation
= individual step of computation
- now : transition relation
= full evaluation
- configurations remain the same
- evaluation relation:

$$\langle P, s \rangle \Downarrow \underbrace{\langle P', s' \rangle}_{\text{last config. of } \langle P, s \rangle \text{'s evaluation sequ. (if } P \text{ terminates)}}$$

"evaluates to"

(Some) axioms & rules

$$\frac{}{\langle !l, s \rangle \Downarrow \langle n, s \rangle \quad \text{if } s(l) = n}$$

(var)

Almost
as before

$$\langle E, s \rangle \Downarrow \langle n, s' \rangle$$

$$\frac{}{\langle l := E, s \rangle \Downarrow \langle \text{skip}, s'[l \mapsto n] \rangle}$$

(:=)

Much simpler:
1 rule instead of 2

$$\langle C_1, s \rangle \Downarrow \langle \text{skip}, s' \rangle \quad \langle C_2, s' \rangle \Downarrow \langle \text{skip}, s'' \rangle$$

$$\frac{}{\langle C_1; C_2, s \rangle \Downarrow \langle \text{skip}, s'' \rangle}$$

(seq)

Example

$$P = \underbrace{(z := !x; x := !y)}_{P'}; \underbrace{y := !z}_{P''}$$

$$s = \{ z \mapsto 0, x \mapsto 1, y \mapsto 2 \}$$

$$\langle P, s \rangle \Downarrow \langle \text{skip}, s' \rangle \quad \text{where } s' = \{ z \mapsto 1, x \mapsto 2, y \mapsto 1 \}$$

$$\begin{array}{c}
 \text{--- (var)} \quad \text{--- (var)} \\
 \text{--- (:=)} \quad \text{--- (:=)} \\
 \text{---} \quad \text{---} \\
 \hline
 \langle P', s \rangle \Downarrow \langle \text{skip}, s'' \rangle \quad \langle P'', s'' \rangle \Downarrow \langle \text{skip}, s' \rangle \\
 \text{--- (seq)} \quad \text{--- (:=)} \\
 \hline
 \langle P, s \rangle \Downarrow \langle \text{skip}, s' \rangle
 \end{array}$$
